## **The Transformer Part II**

# Transformer Layers

Jay Alammar's blog

## Layer Normalization

The Transformer uses layer normalization rather than batch normalization to handle internal covariate shift.

$$\mu_\ell = \frac{1}{TJ} \sum_{t,j} L_\ell[t, j]$$

$$\sigma_\ell = \sqrt{\frac{1}{TJ} \sum_{t,j} (L_\ell[t, j] - \mu_\ell)^2}$$

$$\tilde{L}_{\ell+1}[t, j] = \text{ReLU} \left( \frac{A_{\ell+1}[j]}{\sigma_\ell} (L_\ell[t, j] - \mu_\ell) + B_{\ell+1}[j] \right)$$

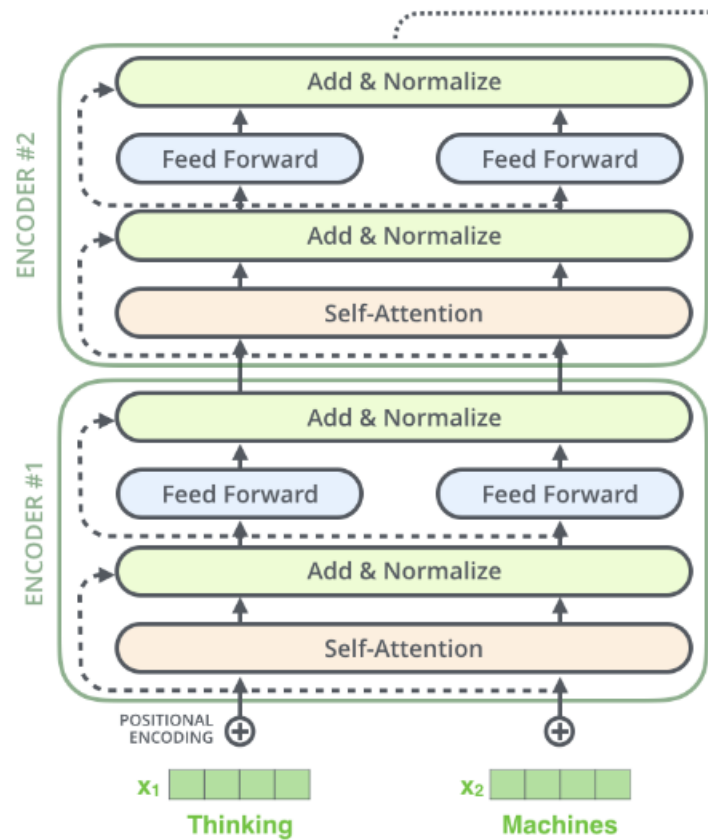

## Feed-Forward Layers

The feed-forward layers apply a two-level multi-layer perceptron (MLP) to the vector at each time position independently.

$$h_{\ell+1}[t, i] = \text{ReLU}(W_{\ell+1}^{\text{FF1}}[i, J] L_{\ell}[t, J] - B_{\ell+1}^{\text{FF1}}[i])$$

$$L_{\ell+1}[t, j] = W_{\ell+1}^{\text{FF2}}[j, I] h_{\ell+1}[t, I] - B_{\ell+1}^{\text{FF2}}[j]$$

# The Transformer

Jay Alammar's blog

## Encoding Positional Information

At the input layer we concatenate the word embeddings with position embeddings.

$$L_0[t, J] = e^W[w[t], I^W]; e^T[t, I^P]$$

Note that without the position embeddings the model has no position information — the input has to be treated as a bag of words.

These days both word embedding and position embeddings are trained as model parameters.

## Language Modeling

To do language modeling we do **causal masking** — we fix  $\alpha[k, t_1, t_2] = 0$  for  $t_2 > t_1$ .

We can then predict the word  $w_t$  as without looking into the future with

$$P(w_t | w_1, \dots, w_{t-1}) = \underset{w_t}{\text{softmax}} \ e[w_t, I] L_{\text{top}}[t-1, I]$$

where  $L_{\text{top}}$  is the top level hidden vector of the Transformer.

# Machine Translation

Translation is just a conditional language model.

This can be done with separate models for the encoder and decoder (an encoder model and a decoder model)

Or it can be done with a **decoder-only** model in which We take the input English sentence followed by a special token and then generate the output from the Transformer language model. In this case causal masking is done on the input sentence as well as the generation of the translation.

## Continuing from a Prompt

GPT-2 from Open AI (1.5 billion parameters, June 2018)

Continue from:

In a shocking finding, scientist discovered a herd of unicorns living in a remote, previously unexplored valley, in the Andes Mountains. Even more surprising to the researchers was the fact that the unicorns spoke perfect English.

## The Predicted Continuation

Continuation excerpted from a single response, the response selected from 10 tries.

The scientist named the population, after their distinctive horn, Ovid's Unicorn. These four-horned, silver-white unicorns were previously unknown to science.

Now, after almost two centuries, the mystery of what sparked this odd phenomenon is finally solved.

Dr. Jorge Pérez, an evolutionary biologist from the University of La Paz, and several companions, were exploring the Andes Mountains when ... Pérez and his friends were astonished to see the unicorn herd. ... While examining these bizarre creatures the scientists discovered that the creatures also spoke some fairly regular English. Pérez stated, "We can see, for example,

that they have a common ‘language,’ something like a dialect or dialectic.”

Dr. Pérez believes that the unicorns may have originated in Argentina ... some believe that perhaps the creatures were created when a human and a unicorn met each other in a time before human civilization. ... However, Pérez also pointed out that it is likely that the only way of knowing for sure if unicorns are indeed the descendants of a lost alien race is through DNA.

...

## GPT-3 from Open AI (175 billion parameters, July 2020)

Continue from: Feeling unproductive? Maybe you should stop overthinking.

In order to get something done, maybe we need to think less. Seems counter-intuitive, but I believe sometimes our thoughts can get in the way of the creative process. We can work better at times when we "tune out" the external world and focus on what's in front of us.

I've been thinking about this lately, so I thought it would be good to write an article about it.

So what exactly does this mean? Well, for starters, let's start with some definitions.

Definition #1: Creative Thinking (CT) is the act of using your mind to come up with ideas that are not already present

in reality or that have never existed before. It is a form of mental activity that involves the use of logic and reason.

Definition #2: Over-Thinking (OT) is the act of trying to come up with ideas that have already been thought through by someone else. OT usually results in ideas that are impractical, impossible, or even stupid.

...

## Few Shot Learning

GPT-3 can be prompted with a sequence of German-to-English translation pairs ending in a German sentence without the English translation.

GPT-3 continues with the English Translation of the given German.

The translation is not close to state of the art but still startling.

Various other tasks can be done with few-shot examples in this way. For example question answering, unscrambling words and three digit arithmetic.
